1 getTissue

1.1 calculate the max and min values from EDM & Skeleton

- we were previously using the histogram function `imagej` but this gives incorrect max and min pixel values, so we do the whole scan ourselves
- the tissue volume is computed from the edm figures, $i^{**2} \cdot \pi \cdot \text{hist}[i]$ where i is a particular value for the edm and `hist[i]` is the count number for that i
